Innovation By Request

For a limited time, buy 4 boxes of Cal-Boost and get \$50.00 back.

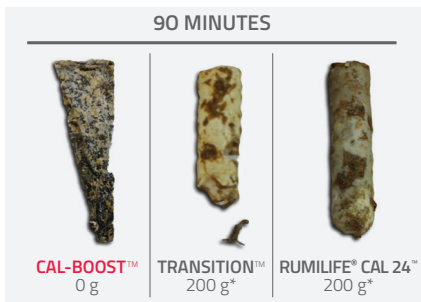

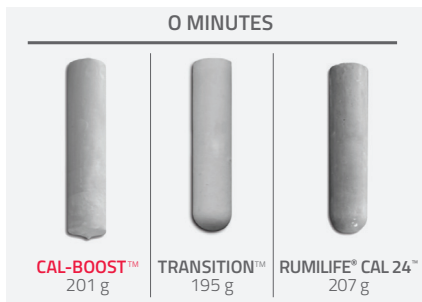

Giving your cows a calcium bolus after calving pays off by reducing the symptoms of clinical and subclinical hypocalcemia during the critical post-calving period.

We recommend Cal-Boost for the following reasons:

**Rapid availability.** According to recent Canadian research trials, Cal-Boost starts dissolving in minutes and is completely dissolved in less than 90 minutes. This makes the calcium readily available to the cow as demonstrated by increased calcium levels in blood serum.

## The Calcium Bolus Advantage YOU CAN SEE

Calcium Bolus Fistula Study<sup>1</sup>

*90 minutes after administering Cal-Boost, all that remains in the rumen is its protective coating*

\* Weight includes rumen fluid absorbed by the bolus 1-Data is available on file

**Convenient.** A recent Canadian research study demonstrated that giving two boluses after calving is the preferred method of administration.

**Safe and easy to administer.** The thick protective coating (acetylated triglyceride) provides smooth administration by allowing easier swallowing.

**Canadian made.** Cal-Boost is made in Calgary. In addition, all research is conducted exclusively in Canada to support Canadian Dairy Producers and the Canadian Dairy Industry.

Redemption cards can be found in specially marked boxes of Cal-Boost.

Visit [calboostpayback.ca](http://calboostpayback.ca) for details.

Rebates must be redeemed by January 31, 2021.
